Fund Risk Assessment Report vs CSI 300

Metric	Value
Data Frequency	weekly
Annualization Factor	52
Rolling Windows	12, 26, 52
Inception Annualized Return	20.98%
Inception Return	84.65%
CSI 300 Return	6.97%
Excess Return vs CSI 300	14.01%
Annualized Volatility	31.11%
Maximum Drawdown	-41.73%
Maximum Drawdown Date	2024-10-18
Tracking Error	34.99%
Information Ratio	0.4005
Sharpe Ratio	0.6102
Sortino Ratio	1.0310
Calmar Ratio	0.5029

Data and Frequency Assessment

The report is based on 166 NAV observations from 2022-11-11 to 2026-01-30. The detected data frequency is weekly, so the analysis uses an annualization factor of 52.

The fund NAV date series defines the analysis timeline. Benchmark levels are aligned to those dates using the most recent CSI 300 observation on or before each fund date.

Rolling metrics are calculated with frequency-aware windows: 12, 26, 52. This prevents daily assumptions from being applied to weekly or monthly data.

Return Performance Commentary

Since inception, the fund generated a total return of 84.65%, equivalent to an annualized return of 20.98% over the observed period.

The year-to-date return is -5.36%, while the trailing one-year return is 14.79%. The win rate is 50.30%, which measures the share of positive periodic return observations.

The return distribution skewness is 0.5154. Positive skewness suggests relatively more upside tail observations, while negative skewness would indicate more downside tail behavior.

Risk and Drawdown Commentary

Annualized volatility is 31.11%, which is classified as elevated based on the rule-of-thumb thresholds used in this report.

The maximum drawdown is -41.73%, occurring on 2024-10-18. This drawdown is classified as material and has not recovered within the available sample.

Drawdown analysis should be read together with the NAV chart and drawdown frequency chart, because maximum drawdown captures only the deepest loss while frequency captures how persistently the fund stayed below prior highs.

Benchmark Relative Commentary

CSI 300 delivered an annualized return of 6.97% over the aligned sample, and the fund outperformed CSI 300 by 14.01% on an annualized basis.

Tracking error is 34.99%, and the information ratio is 0.4005. These measures summarize both the magnitude and efficiency of active return relative to CSI 300.

Benchmark data is aligned to fund NAV dates using the most recent available CSI 300 observation on or before each fund date.

Tail Risk Commentary

The 95% one-period VaR is 2.65%, and the corresponding 99% one-period VaR is also 2.65%. In this sample, both confidence levels map to the same extreme historical observation, which can occur when the return history is limited or observed at a lower frequency such as weekly data. This indicates that tail risk differentiation is limited within the available sample, so the incremental severity normally associated with the 99% threshold is not observable here. The corresponding 10-period VaR at 95% is 8.37%.

The corresponding 10-period VaR at 99% is 8.37%. These figures are estimated under historical simulation using the native weekly return frequency.

The 95% one-period CVaR/ES is 2.65%, while the 99% one-period CVaR/ES is 2.65%. This indicates that the tail contains very few distinct observations; in sparse samples, CVaR can converge to VaR when only a small number of returns fall into the tail. In that setting, VaR-based measures alone provide limited differentiation across extreme loss states and may understate the severity of downside outcomes beyond the observed tail. Tail risk estimates are based on a limited number of tail observations in this sample (approximately 9 observations at the 95% threshold and 3 at the 99% threshold) and may not fully capture extreme loss scenarios. In such cases, greater weight should be placed on drawdown analysis, volatility persistence, and other path-dependent measures when assessing downside risk.

Risk-Adjusted Return Commentary

The Sharpe ratio is 0.6102, which is classified as acceptable. The Sortino ratio is 1.0310, which focuses on downside volatility rather than total volatility.

The Calmar ratio is 0.5029, linking annualized return to maximum drawdown. A lower Calmar ratio suggests that return generation has come with a larger path-dependent downside burden.

The Treynor ratio is 3.1831 and the Treynor-Black ratio is 0.6991. These metrics depend on the aligned benchmark return series.

Conclusion and Risk Notes

Overall, this fund demonstrates a historical risk-return profile that should be interpreted through both absolute performance and path-dependent downside behavior.

From a historical perspective, the fund's risk-adjusted profile appears less robust, and further investigation into downside drivers, market sensitivity, and recovery dynamics would be advisable.

Annualized volatility is 31.11%, so ongoing monitoring should focus on whether future realized volatility remains consistent with the historical pattern.

This report is based solely on historical NAV behavior and should be supplemented with strategy-level due diligence, exposure decomposition, and qualitative review before forming any investment decision.
